

Scenario 2

Thanks for the conversation. We are excited to get started. As discussed, our goal is to build a multi-agent solution to do annual report summarization. When a company posts their annual report an agent should download it, parse it, and provide a summary in an email to our analysts. There should be an agent that can understand tables and another to do images like charts which often contain import information. Currently we always have a junior analyst verify numbers (e.g. check that revenue mentioned in a table matches the same number in a footnote). It is critical that this be done within 24 hours of the report posting. Sometimes analysts will get a call from a client and quickly reach for the summary to get up to speed. The summary must be accurate and correct. Could we run this on our existing AKS cluster?
